Abstract

73°F to 74°F.

I. Introduction

Consider a Potato. If the potato is kept in storage at too high or low temperatures, it will go bad. Similarly, humans will go bad if they have to work in significantly high or low temperatures.

II. Section header

Of course the preferred temperature depends on ones clothing. However, it can be suggested that typical summer and winter ranges for a thermostat temperature be from 73°F to 78°F and 68°F to 74°F respectively [1]. That being said, if we assume that whether it is winter or summer

is unknown [2] we can suggest a typical temperature to be where these two ranges overlap, and thus 73°F to 74°F.

III. Conclusion

The thermostat should be set to a temperature ranging between 73°F to 74°F.
